RESECTOSCOPY

RZ RESECTOSCOPY SETS

Transurethral resection of the prostate (TURP) is a common surgery for BPH (Benign Prostate Hyperplasia). During TURP, the prostate is visualized through the urethra and tissue is removed using electric current. A monopolar or bipolar resectoscope is inserted transurethral and the enlarged prostatic tissue is removed with cutting and sealing electrodes.

LASER ENUCLEATION

LASER ENUCLEATION

Holmium laser prostate surgery is a minimally invasive treatment for Benign Prostate Hyperplasia (BPH). Laser enucleation of the prostate uses a laser resectoscope to enucleate the prostate tissue that is blocking urine flow. A morcellator which passes through the morcroscope is then used to cut the prostate and remove the adenoma.

As with other types of prostate laser surgery, Laser enucleation can offer faster recovery, less risk of bleeding and transfusion and better symptom relief compared to traditional prostate surgery.
